The scientists, led by Dr Brandon Melby at Vanderbilt University Medical Center in Nashville, Tennessee, found that performing at this level is associated with having an older age of onset and symptoms of the condition that become more severe over the course of the lifetime. "There's a discrepancy between IQ in children with autism spectrum disorder (ASD) and the observed abilities of people with autism to function in daily life," explained Dr Melby. "While IQ remains stable throughout a person's life, actual IQs decline significantly over time with age in all people but people with autism struggle to keep up with the average rate of decline in IQ when they reach adulthood," he said. The findings of the study suggest a need to develop strategies that can keep people with autism's IQ stable over time. Study authors Dr Brandon Melby and Dr Mona Lynch. Autism and intellectual disability ASD is a condition that affects children's social development and affects one in 68 children. People with the condition have deficiencies in understanding the social world, interacting with other people, and communicating. ASD is also associated with intellectual disability, which refers to a general under-development of intellectual abilities, including an IQ under 70. A number of genes have been linked to ASD, but so far no single gene has been found that causes the condition alone. The most widely used test of IQ is the Wechsler Intelligence Scale. The authors of this new study chose to study people
